

# TURN YOUR PHONE INTO A 24/7 EARNING MACHINE

## VSMS TECHNOLOGY

**VSMS Token** is a blockchain-based cryptocurrency built on the Solana blockchain, leveraging SMS/Phone Call technology for decentralized mining.

Most telecommunications providers worldwide offer free or "up to" a limited number of SMS messages and Phone calls (minutes) per month, meaning that for many users, sending SMS or making Calls to mine tokens may not incur any additional cost. This feature further lowers the barriers to entry, allowing more individuals to participate in the mining process without financial burden.

## VSMS TOKEN

- 01 Users can mine VSMS by sending SMS messages or make Phone calls, verified on the Solana blockchain via a dedicated mobile app.
- 02 This approach democratizes mining, enabling users, even in areas with limited internet access, to participate in the blockchain economy.
- 03 The project aims to foster financial inclusion through low-cost, accessible mining, supported by a sustainable token buyback system that keeps the mining wallet replenished for future users.

# ECONOMIC STRUCTURE

The VSMS Token (VSMS) ecosystem is built around a sustainable buyback system, allowing users to sell their tokens back to the platform.

Once sold, these tokens are reintroduced into the mining wallet, ensuring that they can be mined again by future users.

This creates a cyclical and self-sustaining flow of tokens within the ecosystem.
